Course Number: RDG 127      Class/Lect.      Lab  
Hours: 50      Hours: 0      Credits: 3      Dept.: DMIR

Course Number Title: RDG 127 Advanved Imaging Modalities      Semester: Summer Extended      Year: 2026

**Course Description, Prerequisite, Corequisite:**

**Advanced Imaging Modalities** introduces students to CT, MRI, and ultrasound imaging with a focus on cross-sectional anatomy and multi-planar interpretation. Students learn how advanced imaging systems create diagnostic images and develop competency in identifying major anatomical structures across all planes and body regions. Restricted to DMIR

**OBJECTIVES/COMPETENCIES**

<b>COURSE OBJECTIVES</b>	<b>COURSE COMPETENCIES</b>
<p>By the end of this course, students will:</p> <ol style="list-style-type: none"> <li>1. <b>Describe</b> the fundamental principles, capabilities, and limitations of advanced imaging modalities including CT, MRI, and Ultrasound.</li> <li>2. <b>Explain</b> how each modality generates images and how acquisition parameters influence appearance and diagnostic quality.</li> <li>3. <b>Develop</b> foundational skills in cross-sectional image interpretation across axial, sagittal, and coronal planes.</li> <li>4. <b>Identify</b> normal anatomical structures as visualized on CT, MRI, and ultrasound across all major body regions.</li> <li>5. <b>Apply</b> spatial reasoning skills to interpret multi-planar reconstructions and correlate anatomy across modalities.</li> <li>6. <b>Recognize</b> when advanced modalities are clinically indicated based on patient presentation, anatomy, and imaging characteristics.</li> <li>7. <b>Communicate</b> anatomical and modality-specific findings using accurate radiologic terminology.</li> </ol>	<p>Upon successful completion of <i>Advanced Imaging Modalities</i>, students will be able to:</p> <p><b>Modality Knowledge &amp; Image Formation</b></p> <ol style="list-style-type: none"> <li>1. <b>Compare and contrast</b> CT, MRI, and ultrasound in terms of physics, signal generation, image acquisition, and clinical application.</li> <li>2. <b>Describe</b> basic CT principles (attenuation, window/level, contrast enhancement, voxel/slice concepts).</li> <li>3. <b>Explain</b> essential MRI concepts (T1/T2, pulse sequences, relaxation, image weighting).</li> <li>4. <b>Identify</b> the basic factors that affect ultrasound image quality (frequency, acoustic windows, echogenicity).</li> </ol> <p><b>Cross-Sectional Anatomy Competency</b></p> <ol style="list-style-type: none"> <li>5. <b>Identify</b> major anatomical structures in the head, neck, thorax, abdomen, pelvis, and extremities on CT, MRI, and ultrasound.</li> <li>6. <b>Differentiate</b> tissues, organs, and vasculature using modality-specific image characteristics.</li> <li>7. <b>Interpret</b> normal anatomical relationships in axial, sagittal, and coronal planes.</li> <li>8. <b>Recognize</b> normal vs. abnormal anatomical appearances at an introductory level.</li> </ol> <p><b>Clinical Relevance &amp; Application</b></p> <ol style="list-style-type: none"> <li>9. <b>Select</b> the most appropriate advanced imaging modality for common clinical scenarios.</li> <li>10. <b>Explain</b> how pathology may alter normal anatomic appearance on CT, MRI, or ultrasound (intro level).</li> <li>11. <b>Communicate</b> imaging findings using appropriate radiologic and anatomical terminology.</li> </ol>
